Today I read « Amazon GO - the Most Advanced Shopping Technology ». The article makes a discussion about this technology. What would shopping look like if you can walk into the store, grab what you want and just go? In fact, the truth is yes. Amazon Go did it with no lines, no checkouts, no registers.

I wonder how does it work, and the article gives me its opinion. They use computer vision, deep learning algorithm and sensor fusion, much like self-driving cars. Their app makes it possible that users' receipt is sent straight to the app and they can keep going.

In a word, I really feel the widely use of deep learning and computer vision. Though my skill ability is not good enough, I won't give up. I will try my best to finish it.
